Monohybrid Cross in Corn INTRODUCTION: A cross between individuals that involves one pair of contrasting traits is called a monohybrid cross. First we will use Punnett square diagrams to predict the results of various monohybrid crosses. We will then examine ears of corn Pur the dominant allele (P), and yellow from the ...

Photos can be substituted: see Corn Genetics Gallery. Dihybrid Cross . We will now consider a dihybrid cross, which is a combination of two monohybrids. Your ear of corn may be a result of a cross between plants that were both heterozygous (PpSs x PpSs). 1. Create a punnett square mathematical system to determine the phenotype ratio.

In my biology honors class, my lab group and I conducted an experiment to apply our newfound knowledge of genetics - using multicolored textured corn. By counting the number of corn kernels by color and texture, we were able to make inferences about the hereditary information which were passed down from the parents....

Background Information: In 1866, Gregor Mendel presented his findings on the inheritance of traits in garden peas and today his work is the basis of modern genetics. Mendel was the first person to successfully derive the rules of genetics. He conducted careful, systematic experiments and analyzed his data mathematically. He proposed that an organism carries two "units" for ...
